December 30, 1964

1964 Crop Season Second To Last Year

The 1964 crop season takes second place only to last year's bumper crop in total production although dry weather conditions threatened major losses in some areas during the growing period, according to the Crop Reporting Board. Wheat production turned out better than last year and the 1964 season favored cotton, peanuts, and other crops in the southern part of the country. The all-crop production index of 109 for 1964 (1957-59 = 100) is 3 points (3 percent) below the 1963 level, but above all earlier years.

Average Yields Decline Per Acre

The uptrend in crop yields per acre was interrupted in 1964 for many crops. Lower yields were indicated for most of the late season crops especially those whose production centers in the North Central Region. Corn, sorghum, soybeans, oats, flax, hay, and sugar beets are among the crops with lower yields than in 1963. Among the several crops that set new highs for yield per acre were cotton, peanuts, rice, tobacco, and barley. Wheat and rye yields were larger than 1963, but not at record levels. The composite index of yields per acre for 28 major crops declined to 114 for 1964, 2 percent (2 points) below the record high in 1963, but exceeding all earlier years.

Total Planted Acreage Down 1 Percent

Acreage of the 59 major crops planted or grown in 1964 totaled 306 million acres--1 percent less than the 309 million acres planted in 1963, but nearly 2 percent more than the record low of 301 million acres planted in 1962. Planting work was delayed by frequent heavy rains in early spring.

Feed grain acreages planted in 1964 totaled 6 percent less than last year with reductions in each of the four crops. Seedings of all wheat were 4 percent larger--winter wheat 3 percent more and spring wheat 7 percent more than in 1963. Soybean acreage expanded more than 8 percent above the high last year.

Harvested Acreage Up Slightly

Total acreage harvested for the 59 major crops in 1964 was 293 million acres--slightly more than the 293 million harvested in 1963. This increase despite decreased plantings, reflects smaller losses of acreage especially in the small grain crops.

Winter Wheat Acreage And Estimate Up

Acreage seeded to winter wheat in the fall of 1964, for harvest in 1965, totaled 45.1 million acres, 4 percent more than seeded in the fall of 1963, and the largest fall seedings since 1953. The 1964 fall seedings were planted with national and farm acreage allotments in effect but with compliance on a voluntary basis.

CURRENT SERIAL NECORDS

A 1965 winter wheat crop of 1,042 million bushels is indicated, based on conditions as of December 1 and other factors. This would be 2 percent larger than the 1964 crop and 8 percent above the 1959-63 average.

Rye Seedings Below 1963 Plantings

Estimated seedings of rye for all purposes in the fall of 1964 totaled nearly 4.4 million acres. Plantings at this level are 6 percent below plantings in the fall of 1963, but 1 percent above average.

¹Preliminary.

²Does not include incentive payment.

Feed Grain Production Down 13 Percent

Production of the four feed grains in 1964 totaled 136.9 million tons, 13 percent less than the 1963 total of 156.4 million tons. Each of the four crops had smaller production totals. 7 percent less acreage was harvested for the four feed grains and each crop declined below last year. Yields per acre were lower than in 1963 for each feed grain except barley. Production declines from last year were 13 percent for corn, 17 percent for sorghum, 10 percent for oats, and 1 percent for barley. The composite feed grain yield of 1.37 tons per acre was 6 percent less than last year's record of 1.46 tons. The 1964 tonnage per acre was the third high of record exceeded only in 1962 and 1963.

Food Grain Production 12 Percent Larger

Food grains produced in 1964 totaled 43.3 million tons, 12 percent more than the 1963 total of 38.6 million tons. All food grains except buckwheat increased from last year. Total acreage harvested was 8 percent larger than in 1963 with increases for each crop. Production of winter wheat, the major food grain, was 13 percent greater than last year and 1 percent above average. Total spring wheat production was 14 percent more than in 1963 with durum showing a 28 percent increase and other spring wheat 10 percent.

Rice production set a new record for the third consecutive year. A higher yield and a small increase in harvested acreage pushed 1964 rice production to 4 percent more than last year. Rye output was 15 percent more than the small 1963 crop and 6 percent above average. Buckwheat production declined 1 percent from last year, and 17 percent from the average.

Oilseed Production Holds Steady

Total oilseed production for 1964 was about the same as a year earlier. Soybean output held about steady but increased cottonseed and peanut production were offset by a decline in flaxseed.

Cottonseed production was 2 percent larger than last year as a high yield per acre more than offset an acreage decline to push the 1964 total 7 percent above last year. Flaxseed output dropped 22 percent because of an 11 percent smaller acreage and a lower yield per acre.

³Commercial; excludes farm slaughter.

Hay and Corn Silage Equal 1963--Less Sorghum Silage

Production of all kinds of hay totaled 116.3 million tons in 1964--about the same as last year, but I percent less than average.

Total acreage cut for hay was 2 percent more than a year earlier, but this increase was offset by a lower yield per acre. In general, hay production was less than last year in the Northeast, North Central, and Western Regions, but more hay was produced in Southern areas. Production of alfalfa, the Nation's number 1 hay crop, was 1 percent larger than in 1963.

Production of corn silage in 1964 totaled practically the same as last year. But sorghum silage tonnage was 17 percent smaller and sorghum forage production was 11 percent less than in 1963.

Tobacco Total 5 Percent Less

Production of all types of tobacco in 1964 totaled 2,230 million pounds--5 percent less than last year's record output. The average yield of 2,066 pounds per acre reached a new record surpassing last year's high of 1,993 pounds, exceeding a ton per acre for the first time.

Sugarcane Hits 4th Successive Record

Production of sugarcane in mainland areas totaled 14.2 million tons--the fourth consecutive record crop--exceeding last year's high by 9 percent, mostly because of increased acreage. The Hawaii total of 10.3 million tons was also a record high.

The 1964 production of sugar beets of 23.2 million tons was slightly less than last year's record high. Growers harvested a record acreage in 1964, 13 percent more than 1963, but a lower yield more than offset the increase in acreage.

Maple sirup production was 37 percent more than last year and the largest production since 1957.

Farm-Retail Price Spreads
Farm-Retail Spread and Farmer's Share of the Consumer's
Dollar for Market Basket of Farm-Food Products

| Year and Month | Retail | Farm | Farm-Retail | Farmer's |

¹Retail cost of average quantities purchased per household in 1960-61 by urban wage-earner and clerical-worker families and single workers living alone, calculated from retail prices collected by the Bur. Labor Statistics.

²Payment to farmers for equivalent quantities of farm produce minus imputed value of byproducts obtained in processing.

NOTE: Data now published are for a market basket containing average quantities of farm-originated foods purchased per household, including households of single persons living alone. The old market basket was representative of purchases by families only. Thus, quantities of foods of the new market basket are smaller than those in the old,

Popcorn and Dry Bean Crops Below Average, Dry Peas Above

Production of popcorn in 1964 was 35 percent larger than last year, but 12 percent less than average.

Dry bean production in 1964 was 14 percent smaller than last year's record and 6 percent below average. Production of dry peas in 1964 was about the same as last year, but 22 percent more than average.

²Revised.

Seed Crops Total 5 Percent Larger

Production of 25 kinds of seeds for hay, pasture, turf and winter cover totaled 5 percent more than last year and average. Increases from last year were indicated for 15 kinds of seed and decreases for 10 others. Record high yields per acre were reported for 6 seed crops and good yields were indicated for many others.

Prepared jointly by Economic Research Service and Statistical Reporting Service.

¹For historical data and explanation of indexes, see, "Changes in Farm Production and Efficiency", USDA, Statistical Bulletin No. 233.

²Preliminary indexes for 1964 based on December 1964 Annual Summary, "Crop Production" report and other releases of the Crop Reporting Board, SRS.

³Gross livestock production includes minor livestock products not included in the separate groups shown, It cannot be added to gross crop production to compute farm output,

4Gross crop production includes miscel'aneous crops not in the separate groups shown, it cannot be added to gross livestock production to compute farm output.

⁵Index crop production per acre is a ratio of total crop production to total land used for crops. It differs from the SRS index of yields per harvested acre of 28 crops.

6 Animal units and production exclude horses and mules.
